

Tuition Management System (TMS)

Super Admin — Detailed Role Specification

Scope: Platform level — oversees every tenant (institution) running on TMS

The Super Admin is Lucaz Soft's own platform-operations role. It does not belong to any single institution — it exists to onboard new tenants, keep the platform healthy, and provide support without ever touching a tenant's data outside a logged, audited session.

1. Tenant Onboarding

Function — Super Admin creates a new tenant (institution) record

System response: the system provisions a new `tenant_id`, an isolated data namespace in PostgreSQL, a default Tenant Admin account with a temporary password/invite link, and applies platform default policies (grace period, booking window, leave policy defaults) that the Tenant Admin can later override.

- Tenant name, PAN/VAT number, and primary contact email are mandatory fields.
- Duplicate PAN/VAT across tenants must be blocked with a clear error, not silently allowed.

Function — Super Admin walks a new institution through the go-live checklist

System response: the system tracks checklist completion (first branch created, first Tenant Admin logged in, fee policy configured, first student enrolled) and shows Super Admin which onboarding steps are still outstanding per tenant.

2. Cross-Tenant Support Access

Function — Super Admin needs to troubleshoot inside a specific tenant

System response: opens an “Audit/Support Login” into that tenant. This is not a silent impersonation — the session is flagged distinctly in the UI (a persistent banner: “Support session — acting inside [Tenant Name]”) so nobody mistakes it for a normal admin session.

- Every action taken during a support session is logged with actor = Super Admin, on-behalf-of tenant, timestamp, and the specific records touched.
- Tenant Admins should be able to see, in their own audit log, when a support session occurred and by whom — this must not be hidden from the client.

3. Platform Policy & Defaults

Super Admin sets the platform-wide defaults that new tenants inherit; Tenant Admins can then override these within their own institution:

Default policy	What it seeds
Geo-attendance grace period	Default minutes before an auto-departure fires.
Petty cash monthly cap	Default ceiling per branch, per tenant.
Appointment booking window	Default minimum advance-notice hours.
Leave policy	Default leave types and approval chain (Branch Admin → Tenant Admin for long sick leave).
Escalation thresholds	Default days before an unresolved maintenance task escalates.

4. Platform Billing & Subscription

Function — A tenant's billing cycle comes due

System response: Super Admin's billing module calculates what that institution owes Lucaz Soft for platform usage (this is separate from the institution's own student-fee billing in Part E of the developer spec) and can flag/suspend a tenant on non-payment per whatever commercial terms are agreed — this module's exact billing model is an open design item (see PRD §26) and must be confirmed before building it.

5. Data Isolation, Security & Monitoring

- Every tenant-scoped table must be isolated by `tenant_id` at the row level; Super Admin's own queries are the only ones permitted to cross that boundary, and only through the audited support-login path above.
- Super Admin can view platform-wide health: active tenant/branch counts, system uptime, error rates — but not tenant business data (fee amounts, student records) outside an audit session.
- Manages platform-level API credentials for social media integrations (Meta, TikTok, LinkedIn) used across all tenants, but cannot view any individual tenant's actual posted content or drafts.

Function — Any Super Admin action is taken anywhere in the system

System response: it is written to an immutable, platform-level audit log — actor, action, target tenant, timestamp — queryable by Super Admin and, for actions inside their own tenant, by that Tenant Admin.

Compiled from Lucaz Soft TMS PRD v2.0 (10 May 2026) and the TMS White Label MSA (effective 29 June 2026). This is a build/QA-ready checklist for this role: every function is paired with the exact system response — the validation, the success state, and the failure/edge-case behaviour.
